Annex A: Indicator Summary Tables

1. Executive Summary

This end-line evaluation assesses the performance, outcomes and transformative potential of the DAPP Malawi humanitarian response to Cyclone Freddy in Nsanje District. The project, launched in March 2023, delivered life-saving assistance, cholera risk mitigation and early recovery support to 1,300 registered households across Khope Camp (GVH Tizola; 600 households) and Mnembe Camp (GVH Mnembe; 700 households). The evaluation applies the OECD Development Assistance Committee (DAC) evaluation criteria (Relevance, Coherence, Effectiveness, Efficiency, Impact and Sustainability), supplemented by ALNAP humanitarian considerations of Coverage and Connectedness.

A mixed-methods design was employed. Quantitative data were collected from a sample of 67 beneficiary households (approximately 5.2% of the registered population) using structured questionnaires administered by trained enumerators. Qualitative insights were drawn from open-ended responses, community feedback and problem-analysis narratives. Data were cleaned, validated and analysed using descriptive statistics, cross-tabulations and criterion-based evaluative scoring.

1.1 Headline Results

Indicator Domain	Key Result
WASH knowledge (KAP)	100% of respondents reported knowledge, positive attitude and preventive practices for WASH-related diseases
Water Guard & hygiene items	100% received and used Water Guard; 100% received and used sanitary pads
Cholera mitigation perception	89.55% reported that project interventions helped reduce or eliminate cholera incidences
WASH homestead assets	91.04% had toilets with hand-washing/tip-tap; 91.04% had waste pits; 97.01% had drying lines
Awareness sessions	97.01% participated in cholera/malaria prevention awareness sessions
Community resilience	74.63% observed positive changes in community resilience to disasters
Willingness for recovery	100% willing to continue recovery efforts beyond the project period
Farmer clubs & VSL	83.58% reported farmer club formation; 65.67% reported VSL promotion
Gender inclusion	100% confirmed involvement of both men and women; 95.52% felt gender-specific needs were addressed
Food assistance coverage	100% received food items through DAPP
Food insecurity (past 6 months)	74.63% reported insufficient household food access — a persistent recovery gap
Overall distribution effectiveness	82.09% strongly agreed food and non-food item distribution was handled effectively
Cooperation with authorities	77.61% very satisfied with project–local authority cooperation

Table 1. Headline evaluation results (n = 67)

1.2 OECD DAC Performance Snapshot

Based on triangulated evidence, the intervention scores highly on Relevance, Coverage and Effectiveness; moderately high on Impact and Coherence; and moderately on Efficiency and Sustainability — primarily due to logistics delays, a constrained nine-month implementation window, and residual food insecurity.

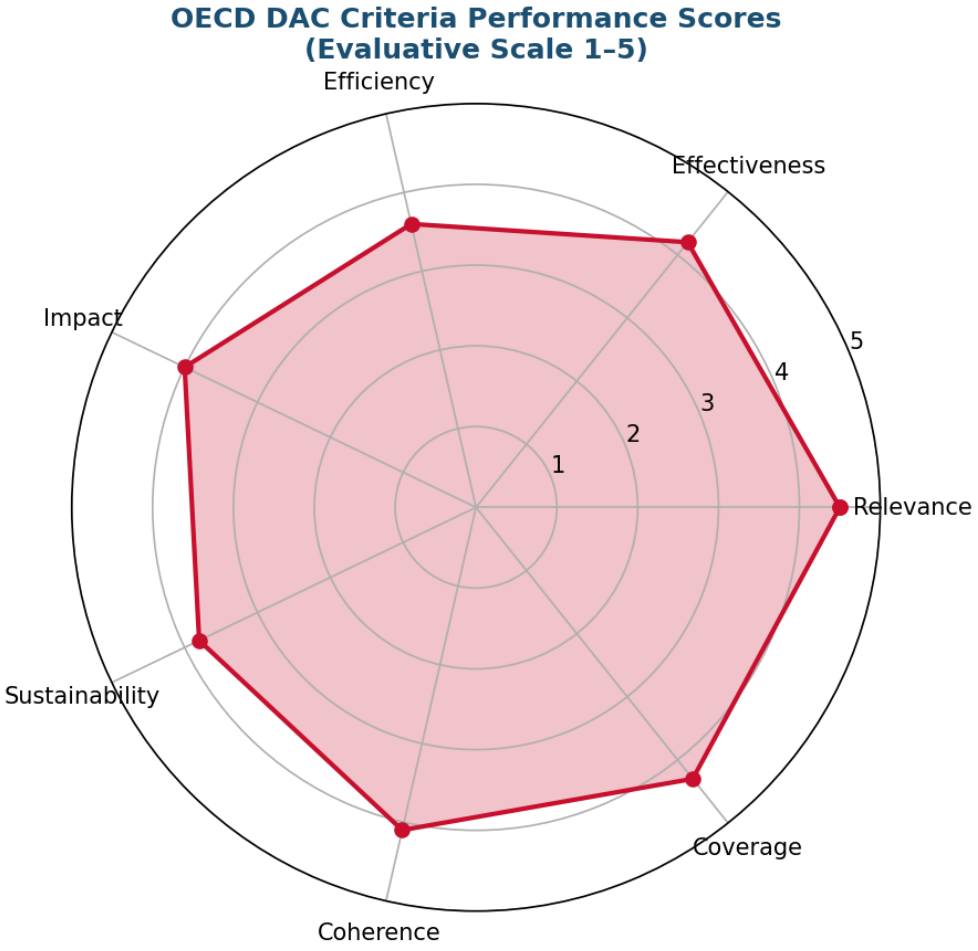

Figure 1. OECD DAC criteria performance scores (evaluative scale 1–5)

1.3 Strategic Implications

The project substantially contributed to life-saving assistance, disease-risk mitigation and early recovery in two high-density displacement settings. Community ownership is strong (100% willingness to continue recovery actions). Priority residual needs include extended recovery support, timely agricultural input delivery, strengthened complaint-handling literacy, and sustained food-security safety nets. The evaluation recommends adaptive, multi-season recovery programming, reinforced logistics systems, and deepened gender-transformative and accountability mechanisms.

2. Introduction and Project Background

2.1 Country and Disaster Context

Malawi faces acute vulnerability to climate-related hazards owing to high exposure to tropical cyclones, floods and dry spells, combined with limited adaptive capacity among rural and peri-urban populations. Nsanje District, situated in the Lower Shire Valley, is among the districts most severely affected by recurrent flooding and cyclone events. Tropical Cyclone Freddy (2023) generated extensive displacement, destruction of shelter and livelihoods, disruption of water and sanitation systems, and elevated risk of waterborne disease outbreaks, including cholera.

In this context, humanitarian actors — coordinated with government structures at national, district and local levels — mounted multi-sector responses spanning emergency relief, WASH, health risk communication, food assistance, and early recovery. DAPP Malawi's intervention formed part of this coordinated response.

2.2 Project Overview and Targeting

Development Aid from People to People Malawi (DAPP Malawi) initiated the Cyclone Freddy humanitarian response project in March 2023. The intervention targeted two densely populated displacement sites: Khope Camp under Group Village Head (GVH) Tizola (600 households) and Mnembe Camp under GVH Mnembe (700 households). Selection was informed by vulnerability to flooding, population density, accessibility and multi-level government consultations, needs assessments and coordination mechanisms.

A total of 1,300 households were registered as project beneficiaries. Demographic registration data indicated that 61% of registered beneficiaries were female and 39% male, underscoring both the gendered profile of displacement vulnerability and the imperative for gender-responsive programming.

Camp / Location	GVH	Registered Households	Share of Total
Khope Camp	Tizola	600	46.2%
Mnembe Camp	Mnembe	700	53.8%
Total	—	1,300	100%

Table 2. Project geographic targeting and beneficiary registration

2.3 Project Objectives

2.3.1 Overall Objective

To contribute to the humanitarian response for people affected by Cyclone Freddy in Nsanje, Malawi.

2.3.2 Specific Objectives

SO1. Provide life-saving assistance to people affected by the Cyclone Freddy emergency.

SO2. Mitigate the risk of cholera spreading in the emergency situation.

SO3. Support early recovery from the impact of the floods and strengthen preparedness for future climate-related disasters.

These objectives map directly onto the humanitarian–development–peace nexus continuum: immediate relief (life-saving assistance), public-health risk reduction (cholera mitigation), and recovery plus disaster risk reduction (DRR) preparedness.

3. Purpose and Scope of the Evaluation

3.1 Evaluation Purpose and Significance

As the culmination of the project cycle, this end-line evaluation provides an independent, evidence-based assessment of whether interventions achieved intended results, for whom, and under what conditions. It serves dual accountability functions — upward to organisational and coordination stakeholders, and downward to affected communities — while generating learning to improve future emergency and recovery programming.

In post-Cyclone Freddy Nsanje, rigorous evaluation is particularly significant: residual vulnerability remains high; climate shocks are recurrent; and investments in WASH, livelihoods, DRR infrastructure and social cohesion must be optimised for both immediate welfare and longer-term resilience.

3.2 Evaluation Objectives

3.2.1 General Objective

To assess the impact, effectiveness and sustainability of humanitarian interventions addressing flooding and related crises, with the overarching goal of informing future initiatives and improving outcomes for disaster-affected communities.

3.2.2 Specific Objectives

• **Measuring Project Impact:** Evaluate overall impact on community resilience, food security, WASH access, health outcomes and socio-economic well-being.

• **Identifying Successes and Challenges:** Document successes, constraints and lessons influencing effectiveness, sustainability and scalability.

• **Evaluating Stakeholder Engagement and Accountability:** Assess participation, leadership engagement and accountability mechanisms across the project cycle.

• **Informing Future Interventions:** Generate actionable recommendations for subsequent emergency response and recovery programming.

3.3 Evaluation Questions

The evaluation was guided by the following core questions, organised by OECD DAC criteria:

Criterion	Core Evaluation Question
Relevance	To what extent did the intervention respond to the priority needs of Cyclone Freddy-affected populations in the two camps?
Coherence	How well was the project coordinated with government structures, local leadership and complementary humanitarian actions?
Effectiveness	To what degree were specific objectives (life-saving assistance, cholera mitigation, early recovery) achieved?
Efficiency	Were resources, logistics and delivery modalities used in a timely and economical manner?

Impact	What significant positive or negative effects — intended or unintended — can be attributed to the project?
Sustainability	Are benefits and capacities likely to continue after project closure, and what conditions enable or constrain this?
Coverage	Did assistance reach the intended population groups, including women and vulnerable households?

Table 3. Core evaluation questions by OECD DAC / ALNAP criterion

4. Evaluation Methodology

4.1 Evaluation Approach and Design

The evaluation adopted a mixed-methods, utilisation-focused design. Quantitative methods (structured household survey and descriptive statistical analysis) generated measurable evidence on participation, satisfaction, asset adoption, knowledge–attitude–practice (KAP) indicators and Likert-scale perceptions of effectiveness. Qualitative methods (open-ended survey items, narrative problem analysis and community feedback) captured lived experiences, implementation challenges and forward-looking suggestions.

The design is primarily outcome-oriented (end-line), with contribution analysis elements linking observed changes to project pathways (WASH promotion → cholera risk reduction; livelihood packages → recovery; DRR structures → resilience). No pure experimental control group was available in the emergency context; findings therefore emphasise credible contribution rather than strict causal attribution.

4.2 OECD DAC Criteria Framework

Analysis is structured around the six OECD DAC evaluation criteria as updated in 2019 — Relevance, Coherence, Effectiveness, Efficiency, Impact and Sustainability — and incorporates ALNAP's humanitarian interpretations (including Coverage and Connectedness). Each criterion is assessed using mixed evidence and scored on a five-point evaluative scale (1 = poor; 5 = excellent), with transparent justification.

4.3 Beneficiary Identification and Sampling

From the 1,300 registered beneficiary households, a sample of 67 households was selected for the end-line survey (approximately 5.2% of the population). The sample size was determined with reference to practical field constraints while seeking acceptable precision for descriptive estimation in a homogeneous camp-based population. Efforts were made to ensure representation across camps, demographic profiles and vulnerability factors to support cautious generalisation to the broader beneficiary population.

Sampling Parameter	Value
Population (N)	1,300 registered households
Sample (n)	67 households
Sampling fraction	≈ 5.2%
Female respondents	41 (61.19%)
Male respondents	26 (38.81%)
Tizola GVH respondents	43 (64.18%)
Mnembe GVH respondents	24 (35.82%)
Mean respondent age	40.72 years (median 36.0; SD 16.62)

Table 4. Sampling frame and achieved sample profile

4.4 Data Collection Instruments and Ethics

Standardised questionnaires were designed to align with project objectives and OECD-relevant indicators, covering demographics, WASH/cholera mitigation, recovery and DRR, nutrition and food security, gender approach, stakeholder engagement, complaints/feedback, Likert-scale effectiveness ratings, and qualitative challenges/suggestions. Trained enumerators administered tools with attention to informed consent, cultural sensitivity, confidentiality and do-no-harm principles, including safeguarding considerations related to PSEA and GBV.

4.5 Data Management and Analytical Methods

Completed questionnaires underwent data cleansing to address inconsistencies and missingness. Analysis employed descriptive statistics (frequencies, percentages, measures of central tendency and dispersion). Where multiple responses were permitted, percentages may sum above 100%. Likert items (1 = Strongly Agree to 5 = Strongly Disagree; and satisfaction scales from Very Satisfied to Very Unsatisfied) were summarised by response category. Qualitative responses were thematically coded into problem, needs and risk clusters. Python-based analytical workflows supported accurate computation, visualisation and reproducible tabulation.

4.5.1 Core Analytical Formulae

Metric	Formula / Definition
Percentage share	$P = (f / n) \times 100$, where f = frequency of category; n = valid responses
Sample fraction	$sf = n / N \times 100$
Arithmetic mean	$\bar{x} = (\Sigma xi) / n$
Sample standard deviation	$s = \sqrt{[\ \Sigma(xi - \bar{x})^2 / (n - 1)\ ]}$
Median	Middle value of ordered observations (or mean of two central values if n even)
Mode	Most frequently occurring value
Likert ‘Strongly Agree’ rate	$SA\% = (n_SA / n_valid) \times 100$
Composite criterion score	Sc = weighted synthesis of indicator performance on a 1–5 evaluative scale
Approximate margin of error*	$MoE \approx z \times \sqrt{[p(1-p)/n]}$ (illustrative; simple random assumption)

*Table 5. Standard evaluation formulae applied in the analysis | *Illustrative under SRS assumptions*

Illustrative precision note: for a proportion near 0.5 with n = 67 and z = 1.96, the approximate 95% margin of error is roughly ±12 percentage points under simple random sampling. Camp-based clustering and purposive elements mean true design effects may differ; results are therefore presented as robust descriptive evidence for management decision-making rather than population parameters with tight confidence intervals.

4.6 Limitations

- The sample represents ~5% of registered households; precision for rare events is limited.
- Absence of a formal comparison group constrains causal attribution; contribution analysis is used instead.
- Self-reported practices (e.g., KAP, food access) may be subject to social-desirability bias.

• Some indicator narratives in secondary summaries showed internal inconsistencies; primary frequency tables in this report are prioritised.

• Recall of cholera case numbers exhibited extreme dispersion (mean far above median), indicating possible rumour amplification or counting of wider-area figures — interpreted cautiously.

• Cross-sectional end-line design limits trajectory analysis over the full recovery pathway.

5. Findings — Demographics of Respondents

Understanding who participated in the end-line survey is essential for interpreting outcome patterns and for assessing whether the sample reflects the registered beneficiary profile (61% female registration).

5.1 Geographic Distribution (GVH)

The majority of survey respondents (64.18%) were from Tizola GVH, with 35.82% from Mnembe GVH. This distribution should be considered when generalising camp-specific infrastructure and recovery findings.

GVH	Frequency	Percentage (%)
Tizola	43	64.18
Mnembe	24	35.82
Total	67	100.00

Table 6. Respondents by Group Village Head

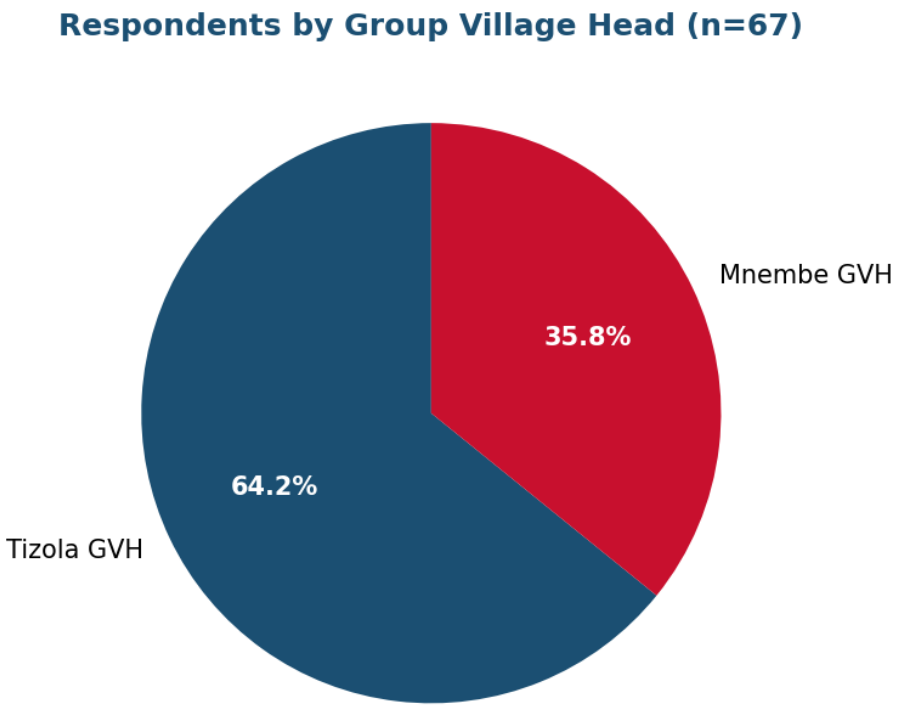

Figure 2. Distribution of respondents by GVH

5.2 Gender

Women constituted 61.19% of respondents and men 38.81%, closely mirroring the registered beneficiary gender profile. High female representation reinforces the need for gender-sensitive design, menstrual hygiene support, and economic empowerment pathways for female-headed households.

Gender	Frequency	Percentage (%)

Female	41	61.19
Male	26	38.81
Total	67	100.00

Table 7. Gender of respondents

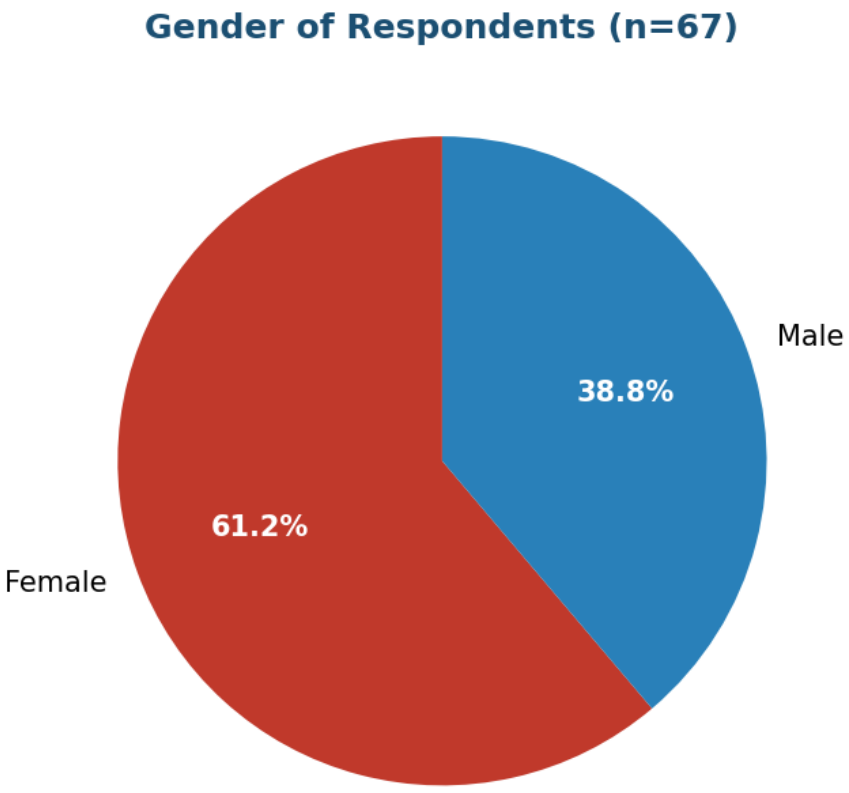

Figure 3. Gender composition of the evaluation sample

5.3 Age Profile

The mean age of respondents was 40.72 years, with a median of 36.00 years, mode of 35.00 years and standard deviation of 16.62 years. The distribution centres on late thirties to early forties, with meaningful dispersion implying multi-generational targeting needs.

Statistic	Value (years)
Mean	40.72
Median	36.00
Mode	35.00
Standard deviation	16.62

Table 8. Age summary statistics

5.4 Marital Status

Most respondents were married (74.63%), followed by widowed (11.94%), separated (7.46%) and single (5.97%). Marital status has implications for household labour allocation, care burdens and vulnerability — particularly for widows and separated persons in post-disaster settings.

Marital Status	Frequency	Percentage (%)
Married	50	74.63
Widow / Widower	8	11.94
Separated	5	7.46
Single	4	5.97

Table 9. Marital status of respondents

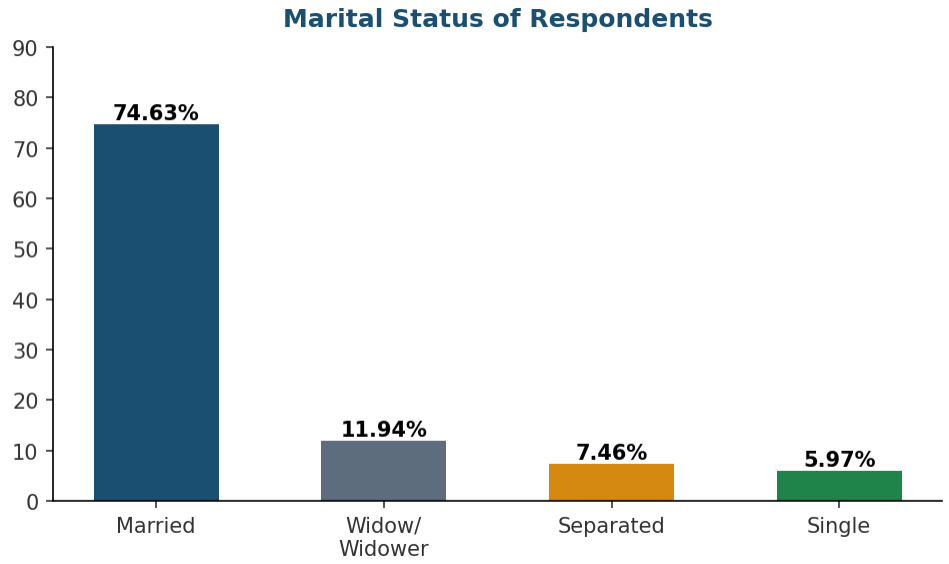

Figure 4. Marital status distribution

5.5 Education Level

Primary-level education was most common (58.21%), while 31.34% had never attended school and 10.45% had secondary education. Low formal education levels have implications for risk-communication design (preferring oral, visual and vernacular channels) and for adult literacy-linked livelihood training.

Education Level	Frequency	Percentage (%)
Primary level	39	58.21
Never attended school	21	31.34
Secondary level	7	10.45

Table 10. Education level of respondents

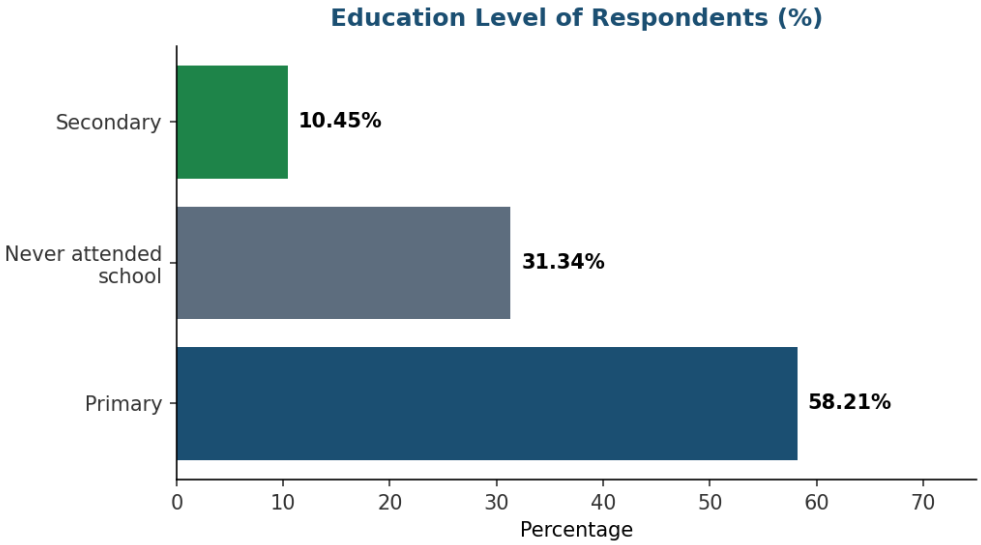

Figure 5. Education profile of respondents

5.6 Main Occupation and Income Source

Self-employment was reported by 52.24% of respondents, while 44.78% reported being unemployed or without a defined occupation, and 2.99% cited other activities (casual labour/farming). Farming was the primary income source for 70.15% of respondents, with casual labour at 22.39%. The livelihood profile confirms agriculture-centred recovery strategies as highly relevant, while also highlighting underemployment risk.

Main Occupation	Frequency	Percentage (%)
Self-employment	35	52.24
Unemployed / Nothing	30	44.78
Other (casual labour / farming)	2	2.99

Table 11. Main occupation of respondents

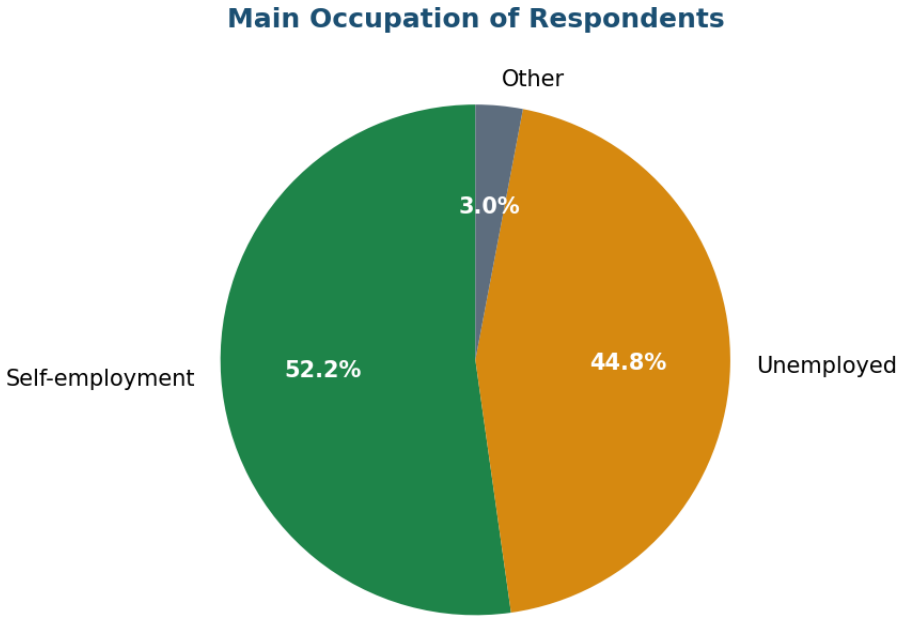

Figure 6. Main occupation distribution

6. Findings — WASH and Cholera/Malaria Risk Mitigation

Specific Objective 2 prioritised cholera risk mitigation. Findings below assess water sources, hygiene knowledge and practices, homestead sanitation assets, awareness sessions, and distribution of Water Guard and menstrual hygiene materials.

6.1 Main Household Water Source

Boreholes dominate household water supply (95.52%), with taps at 2.99% and wells at 1.49%. Heavy reliance on boreholes elevates the importance of water-point functionality, water treatment at household level, and protection of groundwater sources during floods.

Water Source	Frequency	Percentage (%)
Borehole	64	95.52
Tap	2	2.99
Well	1	1.49

Table 12. Main source of water for the household

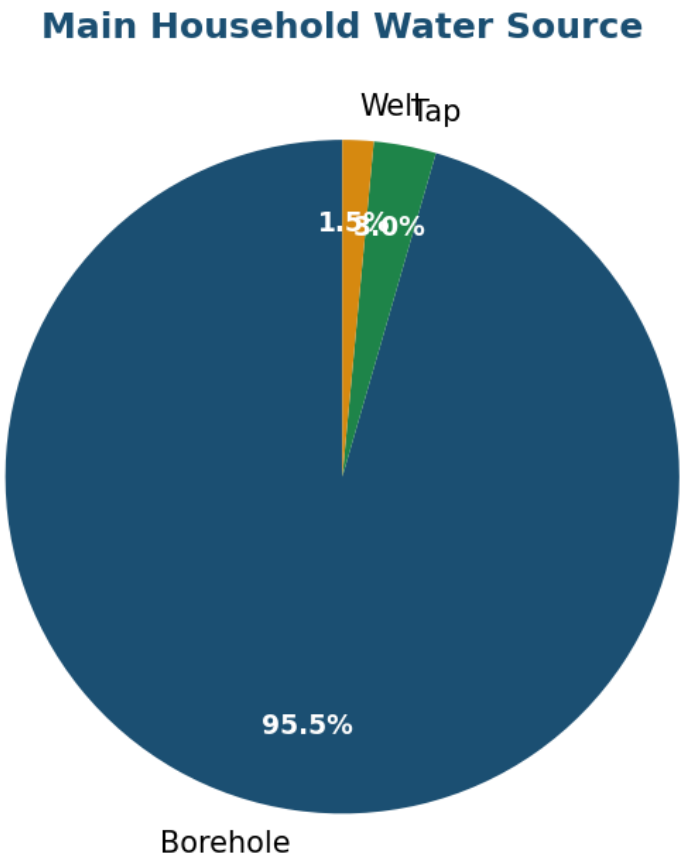

Figure 7. Household water sources

6.2 Knowledge and Awareness on Cholera Prevention

Nearly all respondents (98.51%) reported knowledge of proper sanitation and hygiene practices to prevent cholera. Project-led awareness sessions on cholera/malaria prevention reached 97.01% of respondents. These results indicate strong risk-communication coverage and high cognitive readiness for preventive behaviour.

Indicator	Yes (n)	Yes (%)	No (n)	No (%)
Knowledge of proper sanitation/hygiene to prevent cholera	66	98.51	1	1.49
Awareness sessions on cholera/malaria prevention	65	97.01	2	2.99

Table 13. Cholera-related knowledge and awareness session participation

6.3 Homestead WASH Assets

Adoption of key homestead assets is high: 91.04% reported a toilet with hand-washing facility or tip-tap; 91.04% reported a waste disposal pit; and 97.01% reported a drying line. Residual gaps (~9% without hand-washing facilities or waste pits) remain priority targets for follow-up sanitation support.

Homestead Asset	Frequency	Percentage (%)
Hand-washing facility / Tip-tap	61	91.04
Waste disposal pit	61	91.04
Drying line	65	97.01

Table 14. Households with homestead WASH assets

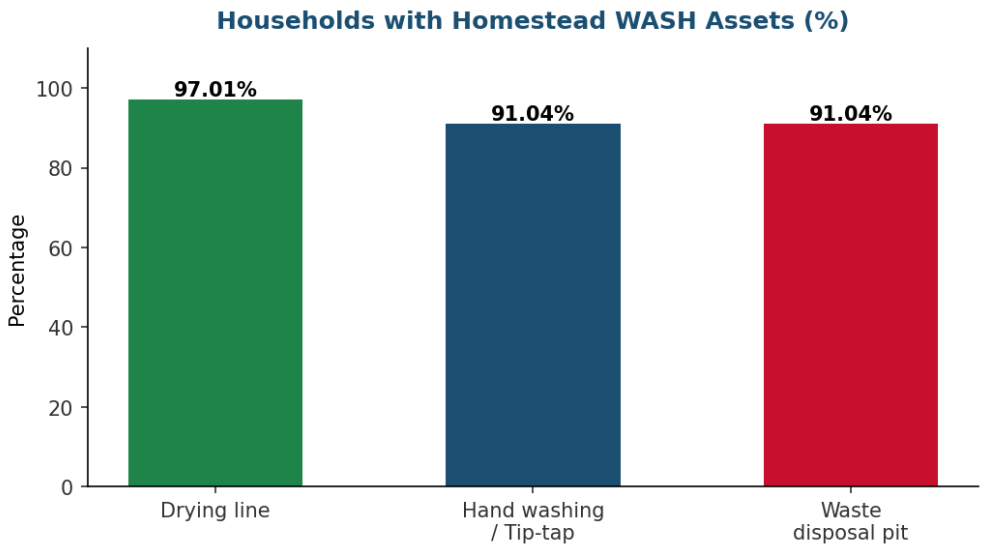

Figure 8. Homestead WASH asset coverage

6.4 Knowledge, Attitudes and Practices (KAP)

All respondents (100%) reported having knowledge, positive attitude and practices to prevent WASH-related diseases. While self-report KAP at ceiling levels is encouraging, continued observation-based monitoring is advisable to verify behavioural consistency under stress conditions (e.g., future floods).

KAP Dimension	Frequency	Percentage (%)
Knowledge	67	100
Attitude	67	100
Practices	67	100

Table 15. KAP to prevent WASH-related diseases

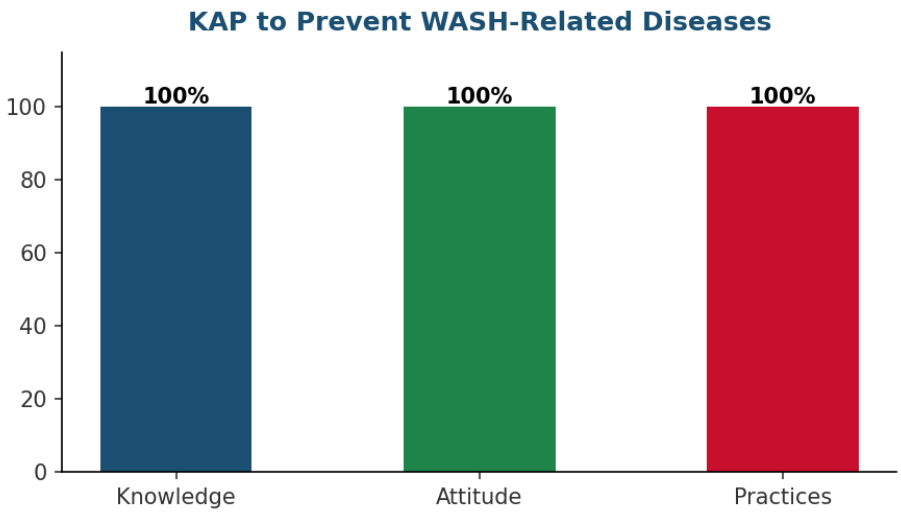

Figure 9. KAP scores for WASH-related disease prevention

6.5 Water Guard and Hygiene Item Distribution

Coverage and utilisation of Water Guard were universal in the sample (100% received; 100% used for intended purpose). Likewise, sanitary pads were received and used by 100% of respondents — a strong result for dignity, menstrual health and gender-responsive relief.

Item	Received (%)	Used as Intended (%)
Water Guard	100	100
Sanitary pads (hygiene items)	100	100

Table 16. Distribution and utilisation of Water Guard and sanitary pads

Evaluative Insight — WASH / Cholera Mitigation

The WASH package demonstrates high coverage, high knowledge transfer and strong asset adoption. This domain is a core success of the response and a major contributor to the Effectiveness and Impact scores under OECD DAC analysis. Residual sanitation gaps and reliance on self-reported practice are the principal caveats.

7. Findings — Cholera Incidence and Recovery Efforts

7.1 Cholera Incidence Awareness

Among respondents, 34.33% reported having heard of cholera cases during or after Cyclone Freddy, while 65.67% had not. Among those who had heard of cases, the mean number of reported cases was extremely high (1,306.74) relative to the median (2.00) and mode (1.00), with a standard deviation of 3,442.16. This dispersion indicates that some respondents likely referenced broader district/national figures or rumours rather than verified local caseloads; the median is the more robust local signal.

Heard of cholera cases	Frequency	Percentage (%)
No	44	65.67
Yes	23	34.33

Table 17. Awareness of reported cholera cases

If yes — reported cases heard (summary)	Value
Mean	1,306.74
Median	2.00
Mode	1.00
Standard deviation	3,442.16

Table 18. Distribution of recalled cholera case numbers (interpret with caution)

7.2 Perceived Impact on Cholera Incidences

A large majority (89.55%) reported that project interventions helped reduce or eliminate cholera incidences, while 10.45% did not. Combined with WASH KAP and asset findings, this constitutes strong beneficiary-perceived effectiveness for Specific Objective 2.

Interventions reduced/eliminated cholera	Frequency	Percentage (%)
Yes	60	89.55
No	7	10.45

Table 19. Perceived impact of interventions on cholera incidences

7.3 Awareness of DRR and Recovery Structures

Awareness of disaster risk reduction or soil and water conservation structures implemented for recovery stood at 92.54%, indicating effective visibility of physical and soft DRR measures.

7.4 Participation in Recovery Efforts

Some 64.18% of respondents participated in Food for Action recovery efforts. Critically, 100% expressed willingness to participate in recovery efforts beyond the project duration — a powerful indicator of community ownership and a positive signal for sustainability.

Indicator	Yes (%)	No (%)
Participated in Food for Action recovery	64.18	35.82
Willing to continue recovery beyond project	100.00	0.00
Aware of DRR / soil & water conservation structures	92.54	7.46

Table 20. Recovery participation and willingness

7.5 Observed Changes in Community Resilience

Positive changes in community resilience were observed by 74.63% of respondents; 23.88% indicated results were not yet visible; and 1.49% were unsure. The substantial 'not yet' share is consistent with recovery pathways that require multiple seasons to consolidate.

Observed positive resilience changes	Frequency	Percentage (%)
Yes	50	74.63
Results not yet	16	23.88
Unsure / do not know	1	1.49

Table 21. Observation of positive changes in community resilience

7.6 Livelihood Protection and Rebuilding Interventions

Respondents identified a multi-component livelihood package. Farmer club formation (83.58%) and VSL promotion (65.67%) were the most widely reported, followed by agricultural inputs (59.70%), goats for female-headed households (47.76%) and riverbank protection (47.76%). Lower but meaningful coverage was reported for food-for-work (35.82%), evacuation routes (34.33%), drip kits (34.33%) and resumption of VCPC/VDRMC structures (28.36%).

Intervention	Frequency	Percentage (%)
Formation of farmer clubs	56	83.58
Promotion of VSL groups	44	65.67
Provision of agricultural inputs	40	59.70
Provision of goats to female-headed HH	32	47.76
River bank protection	32	47.76
Voluntary food-for-work initiatives	24	35.82
Installation of evacuation routes	23	34.33
Installation of drip kits	23	34.33
Resumption of VCPC / VDRMC	19	28.36

Table 22. Project interventions for protecting and rebuilding livelihoods (multiple responses)

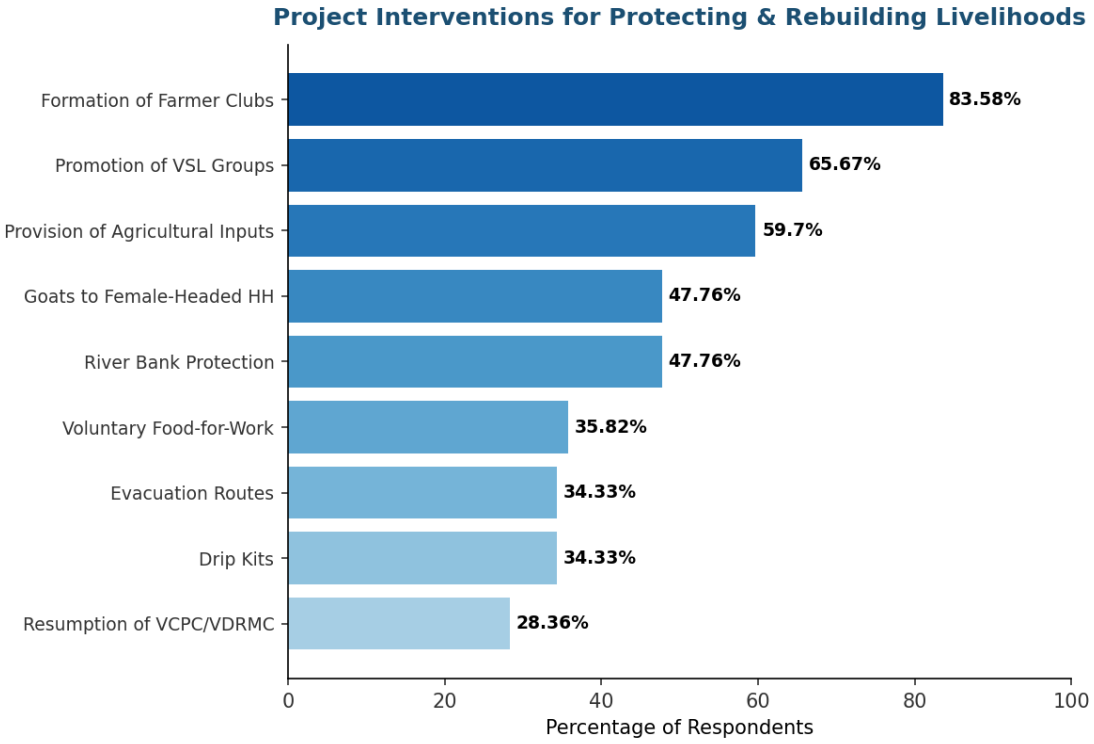

Figure 10. Coverage of livelihood protection and rebuilding interventions

7.7 Energy-Saving Stoves and Environmental Protection

Energy-saving stoves were present in 67.16% of households. Environmental protection activities showed strong uptake: tree planting (88.06%), vetiver planting (77.61%) and riverbank stabilisation (47.76%).

Environmental Activity	Frequency	Percentage (%)
Tree planting	59	88.06
Vetiver planting	52	77.61
Riverbank stabilisation	32	47.76
Do not know / unsure	5	7.46
Other	1	1.49

Table 23. Community environmental protection activities (multiple responses)

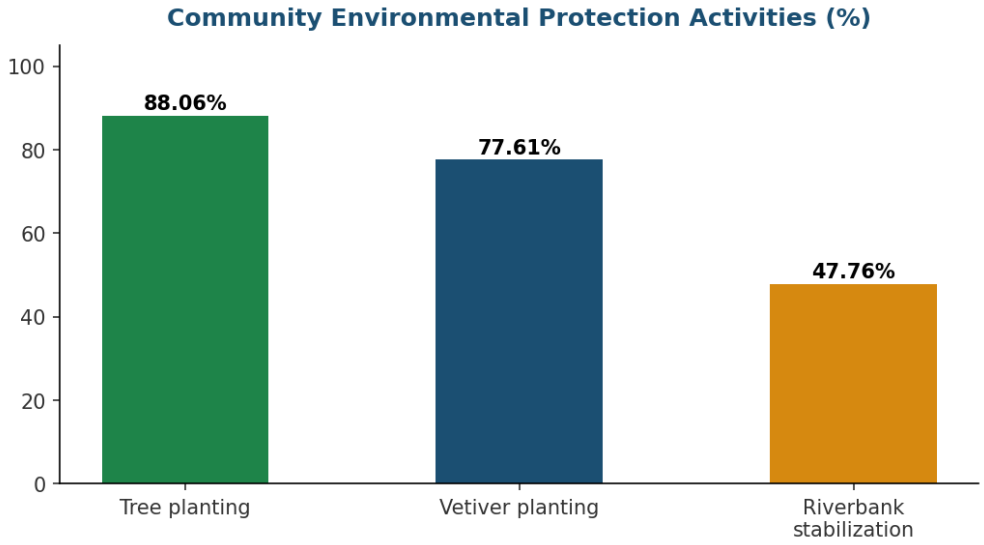

Figure 11. Environmental protection activity participation

7.8 Small-Scale DRR and Water-Management Infrastructure

Community members reported substantial infrastructure works: swales (79.1%), check dams (79.1%), deep/water-holding trenches (61.19%), stone bands/storm drains (32.84%) and riverbank dredging/stabilisation with filled sacks (28.36% in one item; higher yes-rates when asked specifically about construction in the watershed — see below).

Infrastructure Type	Reported Presence (%)
Swales	79.10
Check dams	79.10
Deep trenches / water-holding trenches	61.19
Stone band / storm drain	32.84
Riverbank dredging & stabilisation (sacks)	28.36

Table 24. Community small-scale infrastructures reported

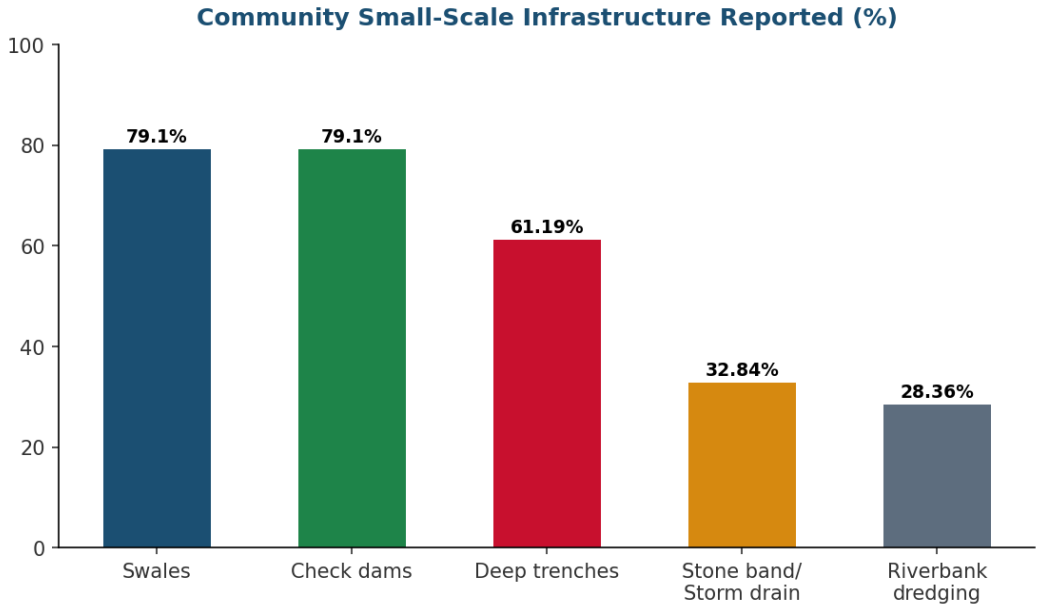

Figure 12. Small-scale DRR / water-management infrastructure

When asked specifically about construction in the watershed:

Structure (watershed-specific)	Yes (%)	No (%)
Deep trenches / water-holding trenches	79.10	20.90
Check dams	89.55	10.45
Storm drain / stone band	64.18	35.82
River dredging & bank stabilisation (sacks)	68.66	31.34

Table 25. Watershed-specific infrastructure construction (respondent reports)

7.9 Early Warning, Alerts and Community Preparedness

Training of community leaders on hazards, communication and alert dissemination via phone-based weather platforms was reported by 82.09% of respondents. About 70.15% said they were invited to receive alert messages; 22.39% were unsure; and 7.46% said they were not invited. Upon receiving messages, 58.21% reported evaluating the information and 55.22% establishing plans. Mean estimated reach of alert-aware individuals in the area was approximately 4,460 (high variance), signalling wide but uneven diffusion.

7.10 Plastic Sheets and Emergency Shelter Support

Plastic sheets provided by DAPP during the Cyclone Freddy response reached 95.52% of respondents. Among uses, 94.03% applied sheets to cover houses and 1.49% to cover toilets — confirming relevance to immediate shelter and sanitation dignity needs.

7.11 Farmer Club Training

Attendance at farmer club trainings was high (89.55%). Training types included modern farming technologies (89.55%), VSL/farmers club management and leadership (74.63%), livestock management (22.39%) and bee farming (7.46%).

Training Type	Frequency	Percentage (%)
Modern farming technologies	60	89.55
VSL / farmers club management & leadership	50	74.63
Livestock management	15	22.39
Bee farming	5	7.46

Table 26. Types of trainings attended through farmer clubs (multiple responses)

8. Findings — Nutrition and Food Security

Food security remains the most constrained outcome domain. While project contributions (training, inputs, clubs, drip kits, livestock) are widely recognised, residual hunger and recovery gaps persist.

8.1 Household Food Access (Past Six Months)

Only 25.37% of respondents reported having access to enough food in the past six months; 74.63% did not. This is a critical residual need and a key driver of the moderate Sustainability score.

Access to enough food (past 6 months)	Frequency	Percentage (%)
No	50	74.63
Yes	17	25.37

Table 27. Household food access over the past six months

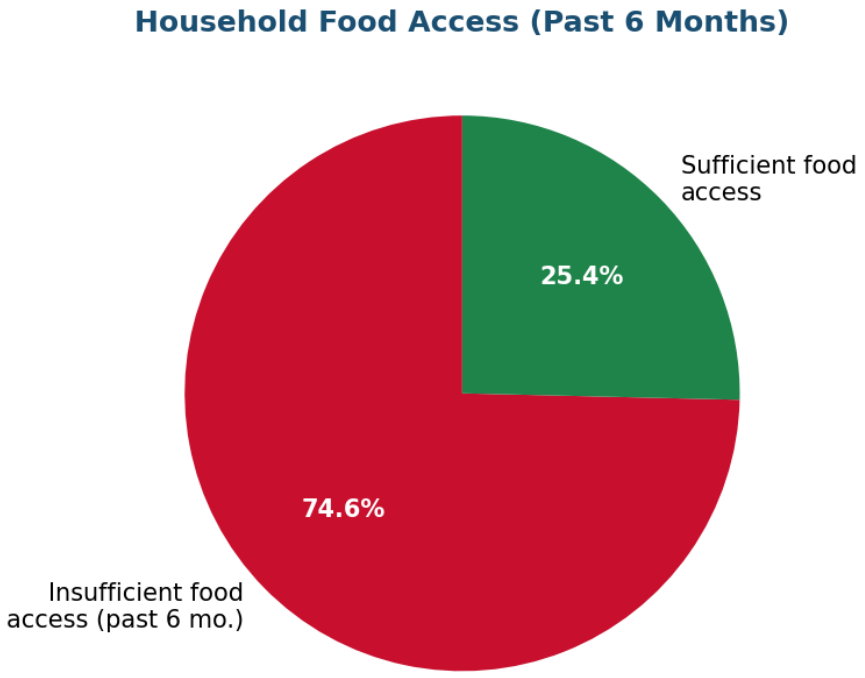

Figure 13. Household food access status

8.2 Drivers of Food Insecurity

Floods were the dominant cited driver (56.72%), followed by dry spells (13.43%), lack of access to land (2.99%) and other reasons (1.49%). Climate shocks therefore remain the structural backdrop to food insecurity.

Reason for insufficient food	Frequency	Percentage (%)
Floods	38	56.72
Dry spells	9	13.43

Lack of access to land	2	2.99
Other (specify)	1	1.49

Table 28. Reasons for not having access to enough food

8.3 Backyard Gardens and Nutrition Challenges

Backyard gardens were present in 67.16% of households. Nonetheless, 77.61% reported challenges accessing nutritious food. Leading challenges included lack of funds (32.84%), high food prices (19.40%), lack of reliable income (17.91%), incomplete recovery from the cyclone (10.45%), uncertainty (5.97%) and other challenges (34.33%).

Challenge accessing nutritious food	Frequency	Percentage (%)
Other (please specify)	23	34.33
Lack of enough funds	22	32.84
Food is too expensive	13	19.40
Lack of reliable source of income	12	17.91
Haven't recovered from the cyclone yet	7	10.45
Don't know / unsure	4	5.97

Table 29. Challenges leading to failure to access nutritious food (multiple responses)

8.4 Community and Project Initiatives

Community-side initiatives included promotion of backyard gardens (68.66%), winter farming (55.22%), planting sweet potato vines (49.25%) and other actions (11.94%). Project contributions most frequently cited were trainings (86.57%), agricultural inputs (56.72%), farmer clubs (53.73%), drip kits (49.25%) and goats (25.37%).

Project contribution to nutrition/food security	Frequency	Percentage (%)
Trainings	58	86.57
Provision of agricultural inputs	38	56.72
Promotion of farmer clubs	36	53.73
Promotion of drip kits	33	49.25
Received goats	17	25.37
Not sure	2	2.99

Table 30. Project contributions to improving nutrition and food security

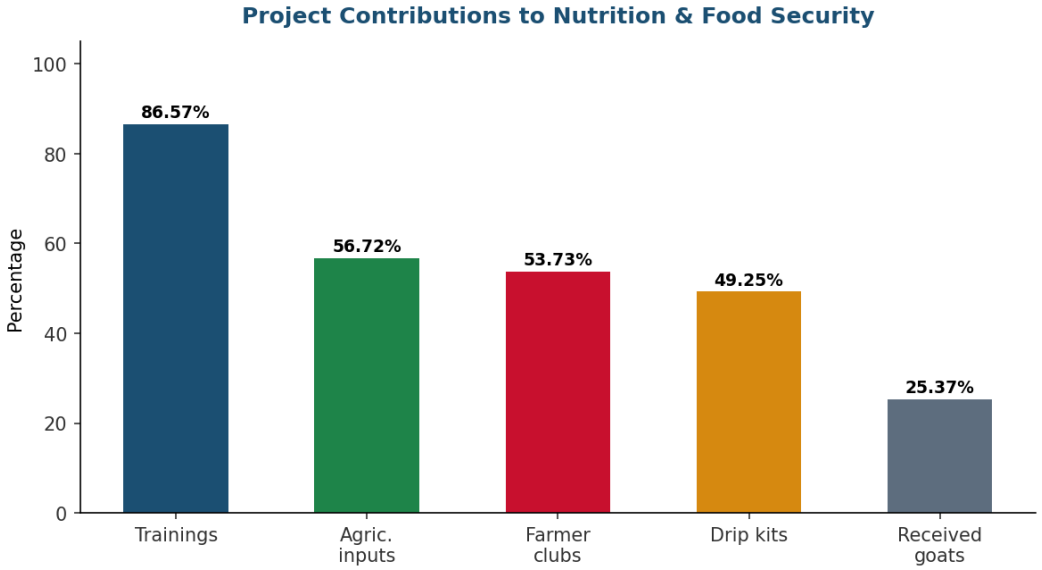

Figure 14. Project contributions to nutrition and food security

8.5 Food Assistance and Pre-Assistance Security Levels

All respondents (100%) received food items through DAPP — full sample coverage for emergency food assistance. Before assistance, self-classified food security was High for 41.79%, Low for 38.81% and Moderate for 19.40%, confirming a heterogeneous but substantially food-insecure caseload at baseline of assistance.

Food security level before DAPP food assistance	Frequency	Percentage (%)
High	28	41.79
Low	26	38.81
Moderate	13	19.40

Table 31. Self-reported food security level before food assistance

9. Findings — Gender Approach

Gender equality and social inclusion were assessed through participation, perceived responsiveness to gender-specific needs, and occurrence/reporting of gender-related issues during implementation.

9.1 Inclusivity and Responsiveness

All respondents (100%) stated that the project involved both men and women. Further, 95.52% believed the project adequately addressed specific needs and challenges faced by both men and women — a strong gender responsiveness signal, reinforced by universal sanitary pad distribution and targeted goat support to female-headed households.

Gender indicator	Yes (%)	No (%)
Project involved both men and women	100.00	0.00
Adequately addressed gender-specific needs	95.52	4.48

Table 32. Gender inclusivity and perceived responsiveness

9.2 Gender-Related Issues and Reporting

A minority (14.93%) reported gender-related issues during implementation, including gender bias (10.45%) and other issues (4.48%). Among those noting issues, reporting was limited (8.96% overall indicated issues were reported), primarily via suggestion boxes (5.97%) and community leaders (1.49%). This pattern points to the need for safer, better-publicised and trusted reporting pathways.

Issue / channel	Percentage (%)
Any gender-related issues during implementation	14.93
— of which gender bias cited	10.45
— other gender issues	4.48
Issues reported (among relevant responses)	8.96
Suggestion box used	5.97
Community leader used	1.49

Table 33. Gender-related issues and reporting channels

10. Findings — Stakeholder Engagement

Community leadership engagement and participatory intensity are central to Coherence, Effectiveness and Sustainability under the OECD DAC framework.

Community leaders were involved during implementation according to 94.03% of respondents. Perceived community participation was High for 79.10%, Medium for 13.43% and Low for 7.46%. These figures indicate generally strong localisation and leadership co-ownership, with a residual minority experiencing limited participation.

Stakeholder engagement indicator	Result
Community leaders involved in implementation	94.03% Yes
High community participation	79.10%
Medium community participation	13.43%
Low community participation	7.46%

Table 34. Stakeholder engagement and participation levels

11. Findings — Complaints and Feedback Mechanisms

Accountability to Affected People (AAP) was assessed through awareness of complaint mechanisms, knowledge of how to submit complaints, actual submission rates and resolution outcomes.

Accountability indicator	Result
Aware of complaint/feedback mechanism	71.64% Yes / 28.36% No
Existence of community complaint response mechanism	68.66% affirmed
Know how to submit a complaint	26.87% Yes / 73.13% No
Ever submitted a complaint (self)	2.99%
Someone in community submitted a complaint	10.45%
Complaints resolved (among reported)	5.97% resolved / 4.48% unresolved
Channels for seeking help on violence — suggestion box	7.46%
Channels for seeking help on violence — community leader	1.49%

Table 35. Complaints, feedback and help-seeking indicators

Evaluative Insight — Accountability

Awareness of mechanisms is moderate-to-good (~72%), but functional literacy on how to submit complaints is low (~27%), and actual use is minimal. Strengthening AAP requires not only presence of boxes and committees, but continuous community education, trust-building, timely feedback loops and protection-sensitive pathways for SEA/GBV disclosures.

12. Findings — Project Effectiveness and Satisfaction

Section findings use five-point Likert scales. For effectiveness statements: 1 = Strongly Agree … 5 = Strongly Disagree. For satisfaction items: 1 = Very Satisfied … 5 = Very Unsatisfied. Results below emphasise top-box (Strongly Agree / Very Satisfied) shares.

12.1 Effectiveness Statements (Likert)

Statement	Strongly Agree (%)	Key additional notes
Food & NFI distribution handled effectively	82.09	Highest effectiveness score
Gender approach ensured men & women in decision-making	76.12	Strong inclusion signal
Willing to participate in protection-risk interventions (self)	73.13	High personal agency
Family willing to participate in protection interventions	70.15	Household solidarity
No complaints regarding project implementation	68.66	Minority dissent exists
No SEA/GBV cases during implementation	68.66	Continued vigilance needed
SWC structures expected to reduce flood overflow damage	64.18	+22.39% Agree
Household effectively adopted WASH/homestead assets	64.18	+28% Agree band strong

Table 36. Project effectiveness — Strongly Agree rates (n = 67)

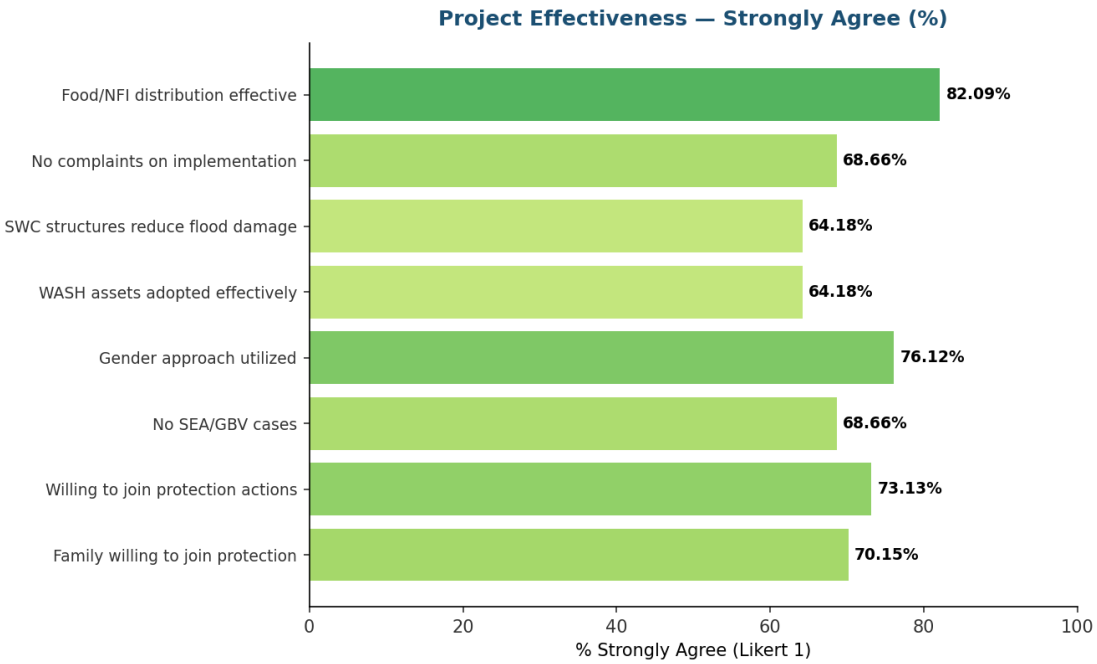

Figure 15. Strongly Agree percentages for effectiveness statements

12.2 Detailed Likert Distributions (Approximate Top Categories)

Distribution of food and non-food items: Strongly Agree 82%; residual categories distributed across Agree / Neutral / Disagree bands (approximately 13% / 4% / remainder). Soil and water conservation efficacy: Strongly Agree 64%, Agree 22%, with smaller Neutral/Disagree shares. WASH asset adoption: Strongly Agree 64%, Agree 28%. Gender approach: Strongly Agree 76%. No SEA/GBV cases: Strongly Agree 69%, with combined Disagree/Strongly Disagree and Neutral shares indicating the need for ongoing safeguarding monitoring despite the majority positive perception.

12.3 Satisfaction Ratings

Satisfaction domain	Very satisfied (%)	Satisfied (%)	Other (approx.)
Cooperation between project team & local authorities	77.61	16.42	Neutral/low ~5.97
Project implementation overall	74.63	19.40	Low dissatisfaction
Effectiveness of community participation	70.15	19.40	~10.45 residual
Complaint resolution process	64.18	10.45	Neutral 22.39; unsatisfied ~3
Nutritional awareness programs	59.70	25.37	Neutral/unsatisfied ~14.94
Resolution of community engagement challenges	56.72	14.93	Neutral ~23.88

Table 37. Beneficiary satisfaction — selected domains

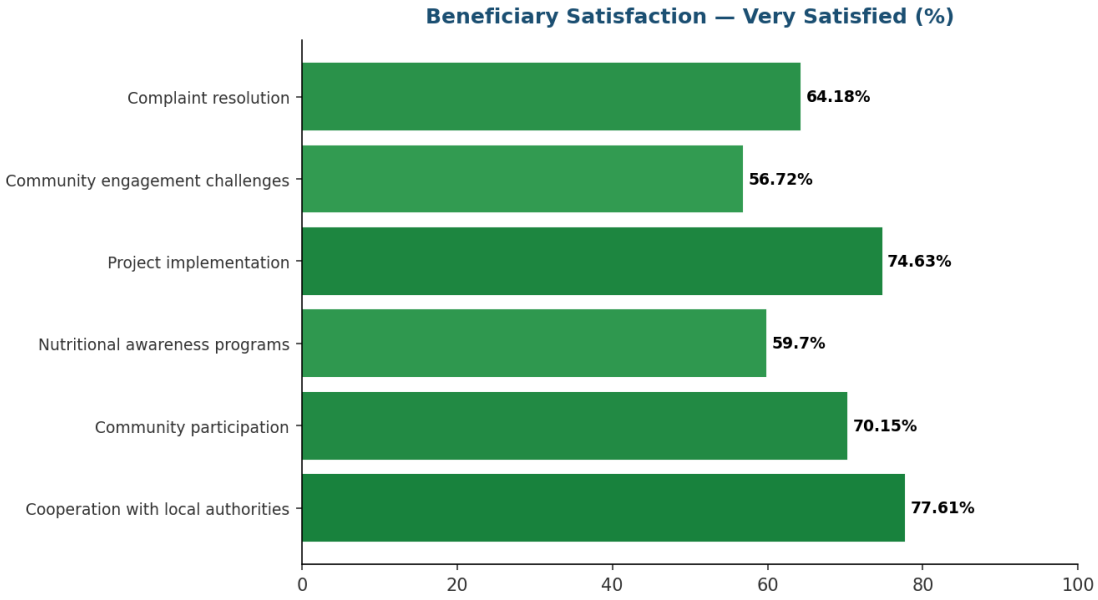

Figure 16. Very Satisfied rates across satisfaction domains

12.4 Qualitative Challenges, Resolutions and Suggestions

Open-ended responses highlighted late delivery of seeds and utensils, theft of food items, perceptions of premature project closure relative to recovery needs, working-structure constraints and occasional denial of

rations. Resolutions mentioned included DAPP commitments to improve future seed/resource delivery; some issues (e.g., theft) lacked reported resolution. Suggestions included project extension, expanded tree planting, social cash transfers, better resource allocation, inclusion of additional affected households, and continued in-kind support. Messages to the project mixed gratitude with requests for extension and deepened assistance.

13. Assessment Against OECD DAC Criteria

This section synthesises quantitative and qualitative evidence into criterion judgements. Scores use a 1–5 evaluative scale (1 = Poor; 2 = Fair; 3 = Moderate; 4 = Good; 5 = Excellent). Scores are professional evaluative judgements grounded in the survey evidence; they are not mechanical averages of single items.

13.1 Relevance — Score: 4.5 / 5 (Good–Excellent)

The intervention was highly relevant to the Cyclone Freddy emergency in Nsanje. Targeting of two high-density camps, multi-sector packages (food/NFI, WASH, cholera prevention, livelihoods, DRR infrastructure, gender-responsive items) and alignment with assessed needs and government coordination pathways demonstrate strong relevance. Persistent food insecurity and calls for extension confirm that needs remain, but do not diminish the appropriateness of the original design.

Evidence anchors: 100% food assistance receipt; 95.5% plastic sheet coverage; 100% Water Guard and sanitary pads; agriculture-centred livelihoods matching 70% farming income dependence; 89.6% perceived cholera reduction.

13.2 Coherence — Score: 4.1 / 5 (Good)

Internal coherence is visible in the linked WASH–health–recovery package. External coherence is supported by high community-leader involvement (94.0%), strong cooperation with local authorities (77.6% very satisfied), and resumption/engagement of VCPC/VDRMC structures for some respondents. Further documentation of inter-agency complementarities would strengthen this criterion in future evaluations.

13.3 Effectiveness — Score: 4.2 / 5 (Good)

Specific objectives were largely achieved in beneficiary perception and indicator performance: life-saving assistance delivered at scale within the sample; cholera mitigation knowledge, assets and perceived case reduction are strong; early recovery actions (farmer clubs, VSL, SWC, trainings) show solid uptake. Effectiveness is tempered by logistics delays, incomplete recovery within nine months, and uneven infrastructure completion across watersheds.

13.4 Efficiency — Score: 3.6 / 5 (Moderate–Good)

Efficiency is the relatively weaker performance area. Late seed and utensil delivery reduced agricultural timeliness and may have diminished return on recovery investments. Theft and trust frictions around distribution imply leakage and transaction-cost risks. Conversely, high coverage of core relief items and strong satisfaction with distribution processes (82.1% strongly agree effective) show that last-mile delivery could also perform well when logistics held.

13.5 Impact — Score: 4.0 / 5 (Good)

Significant positive effects are evident: perceived cholera reduction (89.6%); resilience improvements (74.6%); high WASH KAP and asset adoption; livelihood institutionalisation via clubs/VSL; environmental restoration activities; and emergency shelter support. Residual and possibly negative/unintended dynamics include prolonged food insecurity for many households, trust issues in some committees, and incomplete recovery at closure — partially offsetting net impact.

13.6 Sustainability — Score: 3.8 / 5 (Moderate–Good)

Sustainability prospects are mixed-to-positive. Enabling factors include 100% willingness to continue recovery efforts, farmer clubs and VSL structures, trained leaders (82.1%), physical SWC assets, and high community participation. Constraining factors include residual hunger (74.6% insufficient food access), short project duration relative to recovery needs, logistics fragility, and still-maturing accountability systems. Without extension or complementary safety nets, some gains risk erosion under the next climate shock.

13.7 Coverage (ALNAP) — Score: 4.3 / 5 (Good)

Within the sampled beneficiary population, coverage of flagship entitlements is excellent (food, Water Guard, sanitary pads near/at 100%; plastic sheets 95.5%). Gender inclusion is strong. Some recovery components (drip kits, goats, certain infrastructures) show partial coverage, which may reflect prioritisation or resource ceilings rather than exclusion per se. Community requests to include more affected households suggest boundary pressures beyond the registered 1,300 HHs.

13.8 Criterion Score Summary

OECD DAC Criterion	Score (1–5)	Performance Rating	Evidence Summary
Relevance	4.5	Good–Excellent	Needs-aligned multi-sector design; strong targeting
Coherence	4.1	Good	Leadership engagement; authority cooperation
Effectiveness	4.2	Good	SO1–SO3 largely met; logistics/time constraints
Efficiency	3.6	Moderate–Good	Late deliveries; high coverage when logistics held
Impact	4.0	Good	Resilience & WASH gains; residual food insecurity
Sustainability	3.8	Moderate–Good	Ownership high; duration & hunger constrain
Coverage (ALNAP)	4.3	Good	Near-universal core relief; partial recovery package

Table 38. OECD DAC / ALNAP criterion scores and evidence summaries

Composite mean score (simple average of seven criteria): 4.07 / 5.00 — overall Good performance.

Formula: Composite = (4.5 + 4.1 + 4.2 + 3.6 + 4.0 + 3.8 + 4.3) / 7 = 28.5 / 7 = 4.07.

14. Problem, Needs and Emerging Risk Analysis

14.1 Problem Analysis

Problem	Impact	Associated Risk
Late delivery of seeds	Missed planting windows; reduced moisture utilisation; lower yields	Agricultural failure; household economic loss; food shortages
Nine-month project duration perceived as short	Incomplete recovery; unfinished resilience gains	Relapse into crisis; community dissatisfaction
Theft / ration disputes	Loss of entitlements; eroded trust	Conflict; reduced participation; targeting disputes
Residual food insecurity	Continued hunger; limited nutrition outcomes	Negative coping; health setbacks; stalled recovery

Table 39. Problem–impact–risk matrix

14.2 Needs Analysis

- Project extension / multi-season recovery support beyond nine months.
- Improved, timed delivery systems for seeds, tools and household utensils.
- Deepened nutritional awareness programming with practical, low-literacy methods.
- Stronger community engagement and challenge-resolution processes.
- Exploration of social cash transfer or hybrid cash/in-kind modalities.
- Expanded inclusion of additional cyclone-affected households where resources allow.
- Reinforced AAP literacy so community members know how to submit and track complaints.

14.3 Risk Analysis and Newly Emerging Risks

Risk	Likelihood*	Severity*	Mitigation Direction
Project closure before full recovery	High	High	Extension; phased exit; linkages to longer programmes
Continued hunger / food insecurity	High	High	Safety nets; cash/in-kind; livelihood intensification
PSEA/GBV residual risk	Medium	High	Continuous safeguarding; safe reporting; staff/community training
Trust deficits in committees	Medium	Medium	Transparency; audits; leadership capacity building
Climate shock recurrence	High	High	DRR infrastructure O&M; early warning scale-up
Logistics delays in future cycles	Medium	Medium	Pre-positioning; supplier SLAs; contingency stocks

*Table 40. Risk analysis | *Evaluative ordinal judgement based on survey signals*

15. Key Findings Summary

15.1 Issues Arising

- Late delivery of essential agricultural and household items constrained seasonal recovery.
- Project duration (nine months) was widely perceived as insufficient for full recovery.
- Trust and distribution-integrity issues (theft, ration disputes) surfaced in qualitative feedback.
- Complaint-system awareness exceeds practical knowledge of how to use the system.

15.2 Principal Results by Domain

15.2.1 WASH and Disease Risk Mitigation

Near-universal preventive knowledge and product use; high homestead asset adoption; 89.55% perceived reduction/elimination of cholera incidences; 97% awareness-session coverage. Boreholes remain the backbone water source (95.5%).

15.2.2 Recovery and Resilience

74.63% observed positive resilience changes; 100% willing to continue recovery; strong uptake of farmer clubs, VSL, SWC structures, environmental works and farmer trainings; high plastic-sheet utilisation for shelter.

15.2.3 Nutrition and Food Security

Emergency food assistance coverage was complete in the sample, yet 74.63% still reported insufficient food access over six months. Floods dominate causal narratives. Project trainings and inputs are valued, but economic and climatic constraints persist.

15.2.4 Gender and Accountability

Gender inclusion metrics are excellent at participation level; residual gender bias reports (~10%) and low complaint-submission literacy require continued attention. Majority perceptions indicate no SEA/GBV cases, but safeguarding must remain non-negotiable.

15.2.5 Effectiveness and Satisfaction

Top-box effectiveness and satisfaction scores are consistently high for distribution, gender approach, authority cooperation and overall implementation, supporting a favourable overall performance judgement.

16. Successes, Challenges and Lessons Learned

16.1 Successes

• **Effective multi-sector relief delivery:** Food, NFIs, plastic sheets, Water Guard and sanitary pads achieved very high coverage and utilisation.

• **WASH behaviour and asset gains:** Ceiling-level KAP reports and >90% homestead sanitation assets support cholera risk mitigation objectives.

• **Community ownership:** 100% willingness to continue recovery; high participation and leadership engagement.

• **Livelihood institutional platforms:** Farmer clubs and VSL groups provide vehicles for continued learning, savings and collective action.

• **Gender-responsive elements:** Universal involvement of men and women; sanitary pads; support to female-headed households.

• **DRR and environmental works:** Check dams, swales, trenches, tree/vetiver planting and early-warning training build forward resilience.

16.2 Challenges

• Logistics and timely delivery failures for seeds and some household items.

• Project duration misaligned with full recovery trajectories.

• Persistent food insecurity despite emergency assistance.

• Partial infrastructure coverage in some watersheds / communities.

• Low practical knowledge of complaint submission processes.

• Trust and integrity concerns (theft, committee fairness perceptions).

• Residual gender bias reports requiring transformative follow-up.

16.3 Lessons Learned

• **Community-centred design works:** High participation and ownership validate co-implementation with GVHs, clubs and committees.

• **Speed is a protection and recovery issue:** Late agricultural inputs are not merely administrative failures; they destroy seasonal opportunity.

• **Relief success ≠ recovery completion:** Excellent emergency coverage can coexist with deep residual food insecurity; plan multi-phase recovery from the outset.

• **AAP requires usability, not only presence:** Mechanisms must be understood, trusted and responsive — awareness alone is insufficient.

• **Gender mainstreaming must go beyond parity of presence:** Address bias, leadership quality and safe reporting, not only joint participation counts.

• **Adaptive management is essential in climate emergencies:** Flexible timelines, contingency logistics and iterative community feedback should be built into awards.

• **Invest in local governance integrity:** Committee capacity, transparency tools and social accountability reduce theft and targeting disputes.

• **Hybrid modalities may outperform pure in-kind over time:** Community interest in social cash transfers suggests complementary instruments for recovery phases.

17. Conclusions and Way Forward

17.1 Conclusions

The DAPP Malawi Cyclone Freddy response in Nsanje delivered a relevant, largely effective and impactful humanitarian package to displaced and affected households in Khope and Mnembe camps. Against OECD DAC standards, overall performance is rated Good (composite ≈ 4.07/5), with standout results in relevance, coverage of core relief, WASH/cholera risk mitigation, gender-inclusive participation and community ownership of recovery.

The principal unfinished agenda is recovery completion: three-quarters of surveyed households still lacked sufficient food access over six months; logistics delays reduced agricultural efficiency; and a nine-month window proved short relative to community expectations and climate-recovery realities. Accountability systems are partially institutionalised but under-used. These gaps are solvable with adaptive programming, stronger supply chains, extended accompaniment and deeper AAP investments.

17.2 Way Forward — Strategic Recommendations

R1. Extend and phase recovery support. Design multi-season recovery phases (or formal extensions) with clear exit triggers tied to food-security and livelihood benchmarks rather than calendar time alone.

R2. Professionalise emergency logistics. Pre-position seeds and critical NFIs; establish supplier service-level agreements; deploy real-time distribution tracking to eliminate late planting-season deliveries.

R3. Combine food assistance with livelihood intensification. Pair time-bound food support with winter farming, backyard gardens, drip kits, small livestock and VSL liquidity to attack residual hunger drivers.

R4. Scale functional AAP. Conduct community education on how to submit complaints; diversify safe channels; publish feedback response rates; close the loop publicly.

R5. Deepen gender-transformative and safeguarding practice. Move beyond participation parity to address bias, leadership of women, and confidential PSEA/GBV pathways; maintain zero-tolerance enforcement.

R6. Consolidate DRR assets and early warning. Fund operations and maintenance for check dams, trenches, swales and riverbank works; expand phone-based alert enrolment and action planning drills.

R7. Strengthen local governance integrity. Train VCPC/VDRMC and distribution committees on transparency, targeting SOPs and conflict resolution; introduce community scorecards.

R8. Institutionalise learning. Embed real-time monitoring dashboards, post-distribution monitoring and after-action reviews into all future DAPP emergency responses, using OECD DAC questions from design stage.

17.3 Closing Statement

Cyclone Freddy tested the resilience of Nsanje's communities and the agility of humanitarian partners. DAPP Malawi's response demonstrably saved dignity, reduced disease risk and seeded recovery institutions. Sustaining these gains will require the same energy that launched the response — applied now to logistics excellence, extended recovery, accountable local systems and climate-ready community structures.

Disclaimer: Findings and recommendations are based on the end-line survey of 67 households and associated project information provided for analysis. They are intended to support organisational learning and accountability and should be read alongside operational monitoring data and inter-agency assessments.

Annex A: Consolidated Indicator Summary

Priority indicators at a glance for management dashboards and future baseline/end-line comparison.

#	Indicator	Result
A1	Female respondents	61.19%
A2	Borehole as main water source	95.52%
A3	Cholera hygiene knowledge	98.51%
A4	Cholera/malaria awareness sessions	97.01%
A5	Toilet with hand-washing / tip-tap	91.04%
A6	Waste disposal pit	91.04%
A7	Drying line	97.01%
A8	KAP (knowledge / attitude / practices)	100% / 100% / 100%
A9	Received & used Water Guard	100% / 100%
A10	Received & used sanitary pads	100% / 100%
A11	Interventions reduced cholera (perception)	89.55%
A12	Positive resilience change observed	74.63%
A13	Willingness to continue recovery	100%
A14	Farmer clubs formed (reported)	83.58%
A15	VSL groups promoted (reported)	65.67%
A16	Insufficient food access (6 months)	74.63%
A17	Received DAPP food assistance	100%
A18	Men & women involved in project	100%
A19	Gender-specific needs addressed	95.52%
A20	Community leaders involved	94.03%
A21	High community participation	79.10%
A22	Aware of complaint mechanism	71.64%
A23	Know how to submit complaint	26.87%
A24	Food/NFI distribution effective (SA)	82.09%
A25	Very satisfied — cooperation with authorities	77.61%
A26	OECD DAC composite score	4.07 / 5.00
